

Team Avengers

Agenda

This is the third set in the series of Avengers training. This will be given with 1 use case. This consists of 10 Points.

Use Case

We need to deploy the sample website with the following content using nginx.

Task

1. Provision either local VM or AWS VM.
2. Write a shell script with a custom nginx configuration file for deploying a website in the remote machine.
3. All the source code (code for website) and the shell script should be packaged as tar.
4. Anybody should be able to untar the package and by running the shell script should deploy the website in the target machine.
5. By running the shell script the user should be asked about the target machine.

Contents are attached in the file.
